ITEC 204 – Data Structures and Algorithms

Name: Reance Del C. Empalmado	Date: 09/24/2026
Section: BSIT-2A	Instructor: Maxyne Nuela Ignacio

- I. **Objective:** Write a short explanation of what your program is designed to do. (Minimum of 3 sentences)

Answer:

The program is designed to manage incident tickets generated by automation bots. It stores each incident ticket in a linear data structure and allows the user to add, display, search, remove, and count active incident tickets. The program uses a menu-driven interface so the user can select and perform different ticket management operations.

- II. **Program Operations:** Briefly explain how your program performs each operation. (Insert Specific Code Line and Your Explanation)

Add Incident:

- a. The program is designed to manage incident tickets generated by automation bots. It stores each incident ticket in a linear data structure and allows the user to add, display, search, remove, and count active incident tickets. The program uses a menu-driven interface so the user can select and perform different ticket management operations.

Display Incidents:

Specific Code Line: 63–69

The `display_tickets()` function displays all active incident tickets. It uses a for loop to go through each ticket in the tickets list and prints the Incident ID, Bot, and Description.

Search Incident:

Specific Code Line: 87–97

The program asks the user to enter an Incident ID to search for. It loops through the tickets and compares the entered ID with each ticket's ID. If a matching ticket is found, its details are displayed; otherwise, the program displays "Ticket not found."

Remove Resolved Incident:

Specific Code Line: 100–108

The program asks the user for the Incident ID of the resolved ticket. It searches the list for a matching ticket and uses `tickets.remove(ticket)` to remove it from the active tickets.

Count Active Incidents:

Specific Code Line: 111–112

The program uses `len(tickets)` to determine the number of active incident tickets currently stored in the list. The total number is then displayed to the user.

III. Flowchart:

IV. Conclusion:

From this activity, I learned how to use a linear data structure to organize and manage incident tickets in a Python program. I applied list operations such as adding, searching, removing, displaying, and counting tickets. This activity also helped me understand how a menu-driven program can connect different data structure operations into one practical IT-related application.
